Softcopy Orthophotomap Data Base (SODB)

The *Softcopy Orthophotomap Data Base* consists of geometrically corrected aerial photographs of New Brunswick. They are generated by removing the effects of tilt and relief from the aerial photographs by a process called ortho-rectification. An orthophotomap may serve as a base layer onto which other map information may be placed over.

The orthophotomaps are currently available for download as individual map windows (1:10,000) in these image formats: TIFF (4-metre resolution) and MrSid (1-metre resolution). However, they are not available for all regions of the Province. Here is an approximate view of the orthophotomap availability: (use the [Products & Services](#) section for more details)

Please note: For more information on these upcoming products and services, please use the [Communication](#) link on the **Geographic Data & Maps – Main Page**.
